If your eCommerce site is not yet live and you have a temporary URL to preview and build out the site...

Instead of using an INTERNAL link like this:

https://s-rsmqbo-combo.integrasoft.net/ecommerce/erental/productimages/Lifts_cat_74_l_lifts_cat_30_l_liftsbanner.jpg

You should always be updating/adding your links within the software to remove everything before /ecommerce, like this:

==/ecommerce/erental/productimages/Lifts_cat_74_l_lifts_cat_30_l_liftsbanner.jpg==

This is called a relative URL.

Web browsers are programmed to place the file or page path on the CURRENT domain for relative links...

...whether it's https://s-rsmqbo-combo.integrasoft.net

Or it's.. https://yourbusinessurl.com

The end result is that the link will work on your temporary url

...and will work when you take your ecommerce site live on your owned/desired url.

Doing this will prevent potentially broken links, images, and "Security Errors" as the SSL Certificate, to be installed, will only protect the FINAL URL of your site, and not the temporary one after your site has gone live on a new domain or a sub-domain.

Run a full site publish via **iNextAdmin > Site > Publish UI > Publish Rental Site**

- Verify changes show on your customer-facing site (you may need to hard refresh with CTRL+F5 or clear your cache / open in an incognito window).

If you have any issues, please reach out to your Digital Experiences consultant or the support team through the usual channels.
